# SAVING ENERGY IN HOSPITALS WITH PASSIVE HOUSE TECHNIQUES

Increasing Efficiency, Protecting Assets and Reducing Operating Costs

Responsive buildings.  
Responsive people.

# INTRODUCTIONS

Andrew Kozak, P.E.  
Principal, Engineer  
AEE Fellow, LEED AP  
akozak@brplusa.com

Abbott Price  
Sustainable Design Engineer  
CPHC, WELL AP, EMIT  
aprice@brplusa.com

# LEARNING OBJECTIVES

- Define changing local and national carbon and energy consumption regulations, and their intersection with healthcare requirements like ASHRAE 170.
- Recommend areas of design where Passive House strategies can be most impactful on overall energy consumption.
- Compare case studies of Hospital projects utilizing Passive House.
- Conclude how a Passive House principles and techniques can have a high impact on new Hospital design and construction projects.

## GOAL:

*Improve energy performance of healthcare facilities while delivering quality care and improving patient outcomes.*

## STRATEGY:

*Build efficient buildings, to lower heating and cooling loads. Meet those heating and cooling loads with fully electrified equipment and renewable energy.*

# STRATEGY

Shaping Tomorrow's Built Environment Today

Energy Efficiency

Electrification  
(Heat + Hot Water)

Renewable  
Energy

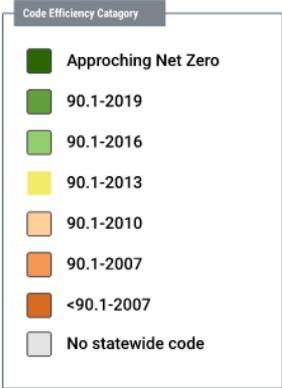

# OVERVIEW

1. Context: Changing Regulation
2. Defining Passive House
3. Defining Healthcare Environment: Energy Intensive Features
4. Case Study 1: PH Strategies Employed
5. Case Study 2: Cost of PH
6. How to Future Proof: Best Practices

**CONTEXT: CHANGING REGULATIONS**

# NATIONAL ZNE CODE PRECEDENTS

Updated on 12/19/22

**Seattle**  
Approching Net Zero

**California**  
Title 24-2019  
(near residential NZE)  
Zero Code  
(commercial proposed)

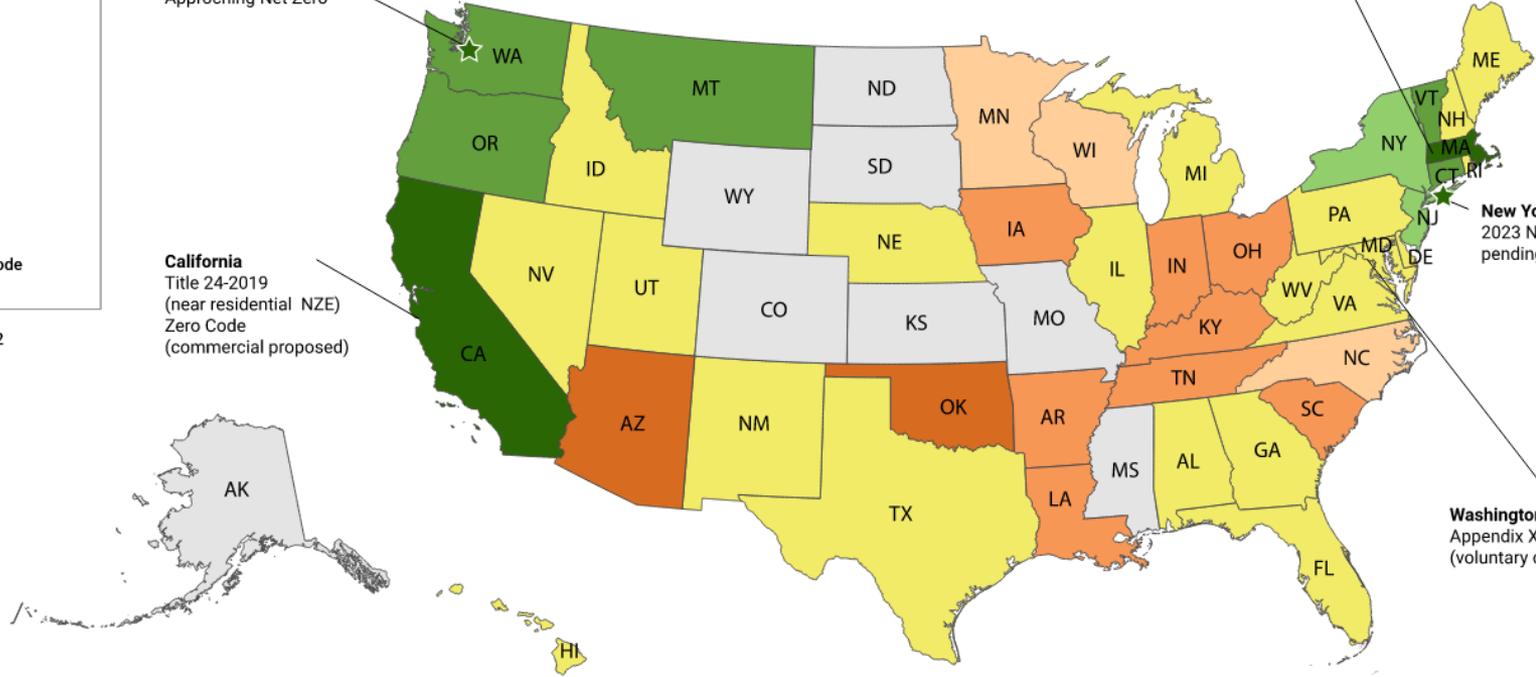

**National**  
IECC 2021  
ZNE Appendix  
IECC 2030/ ASHRAE 90.1-2031 = Approching ZNE

**Massachusetts**  
2023 Stretch Code  
Specialized Opt-In  
Fossil Fuel Free Pilot

**Boston + Cambridge + Others**  
ZNC zoning regulations  
BERDO/BEUDO existing  
bldg. regulations

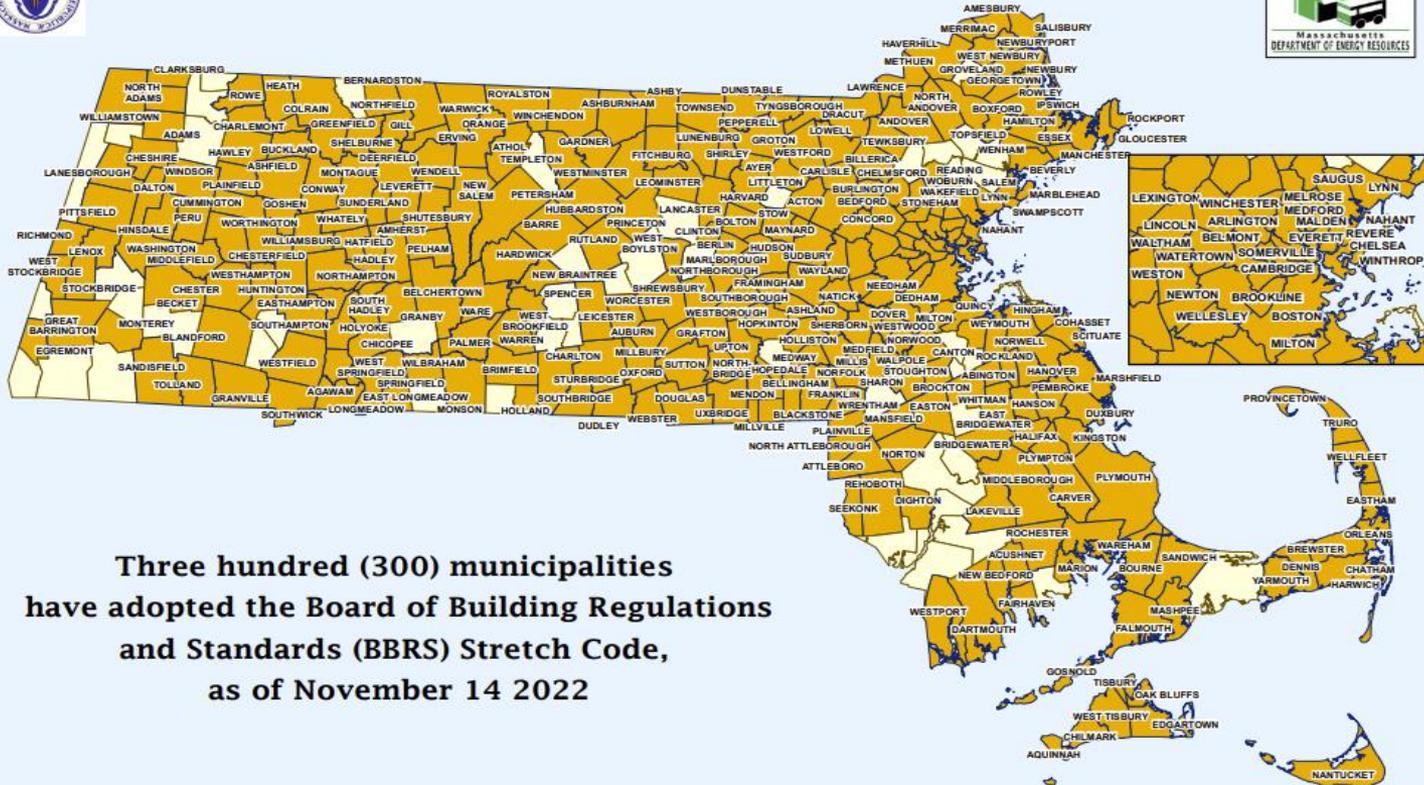

**New York**  
2023 NYS Stretch Code  
pending

**Washington, DC**  
Appendix X  
(voluntary compliance path)

# Boston Carbon/Energy Regulation

## Stretch Code Adoption, by Community

**Three hundred (300) municipalities  
have adopted the Board of Building Regulations  
and Standards (BBRS) Stretch Code,  
as of November 14 2022**

# NEW YORK CITY: LOCAL LAW 97

## NYC 80 x 50

80% carbon reduction by 2050

## LOCAL LAW 97

2024-2029 limits will affect the 20% most carbon-intensive buildings

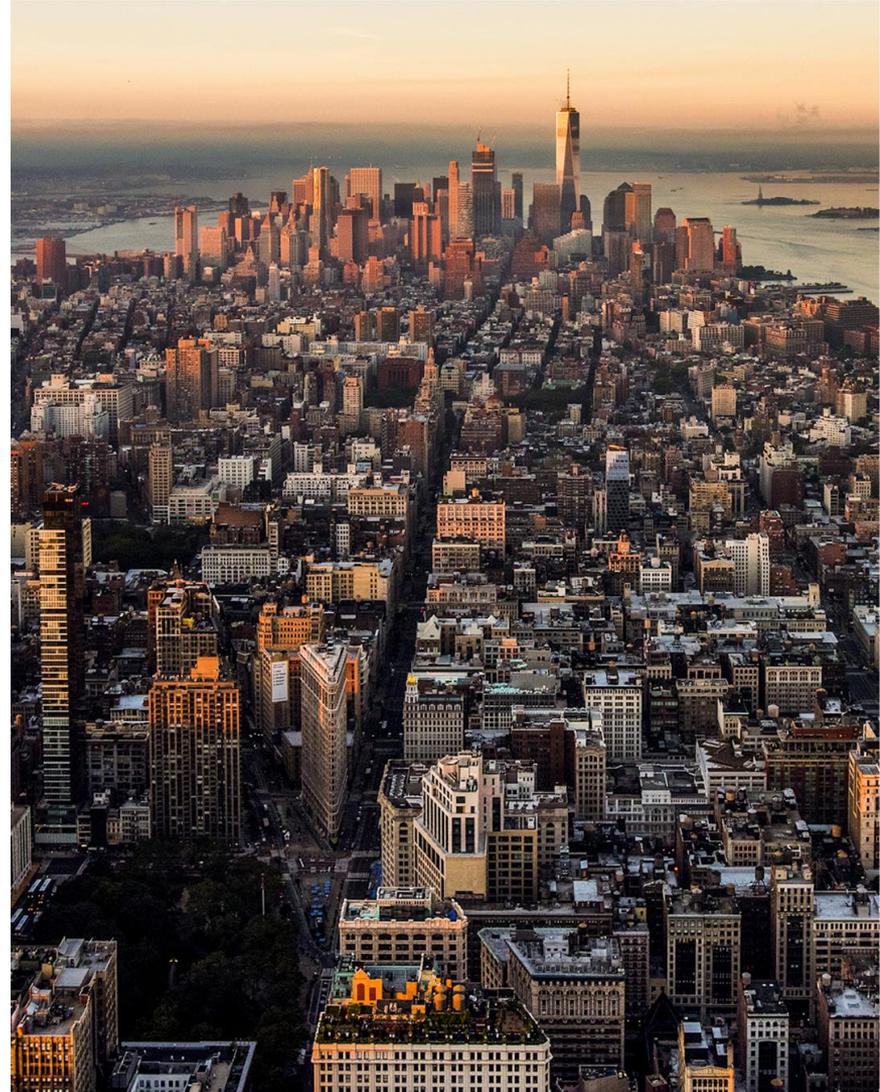

2030-2034 limits will affect the 75% most carbon-intensive buildings

Expensive penalties to those buildings exceeding the limits.

## Local Law 154 - NYC Natural Gas Ban

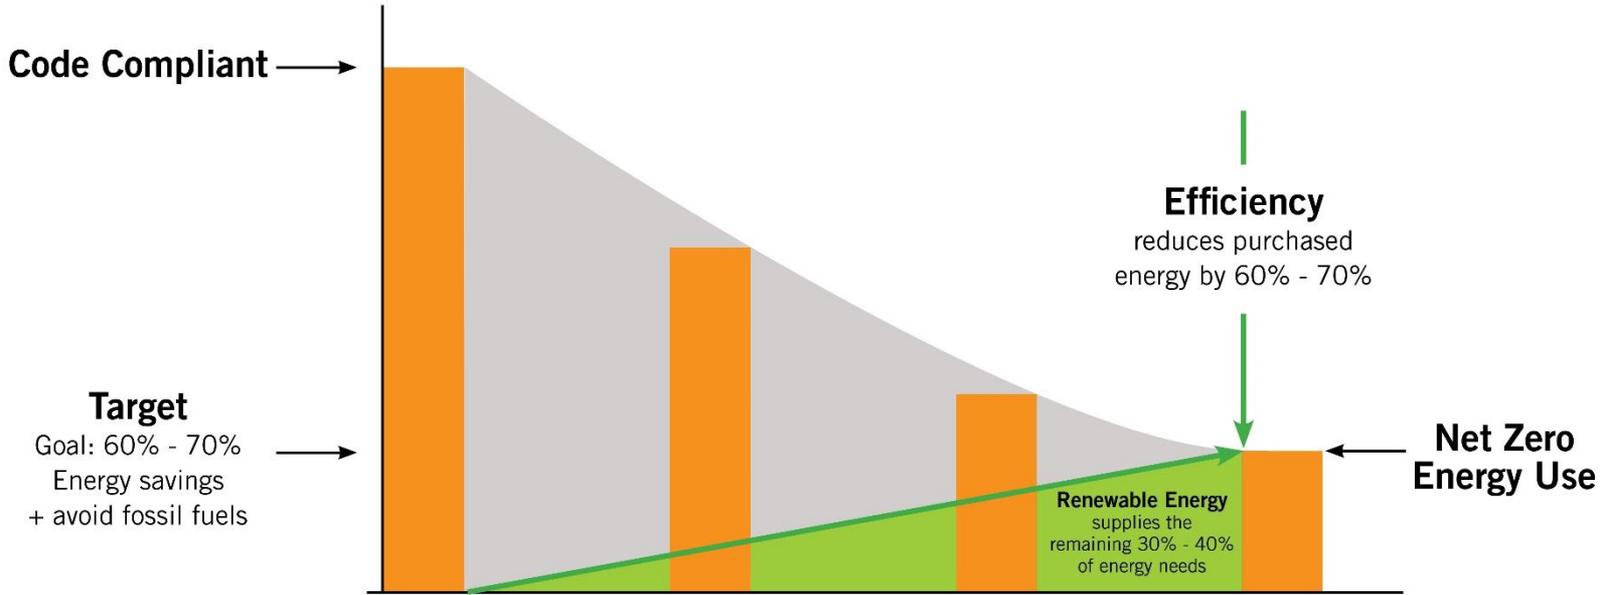

2023 – buildings below 7 stories

2027 - all buildings

# Path to Net Zero Energy Use

+

# ASHRAE 227

## Proposed Passive Building Design Standard

Authorities having Jurisdiction can adopt as a path to compliance using Passive House Building design principles.

- Envelope
- Heating and cooling equipment
- Ventilation
- Service hot water
- Lighting
- Plug loads

# DEFINING PASSIVE HOUSE

# WHAT IS PASSIVE HOUSE?

Design and construction concept – Focus on Balance Gains and Losses

Highest Energy Standard – PHI and PHIUS

Quiet, clean, healthy, comfortable

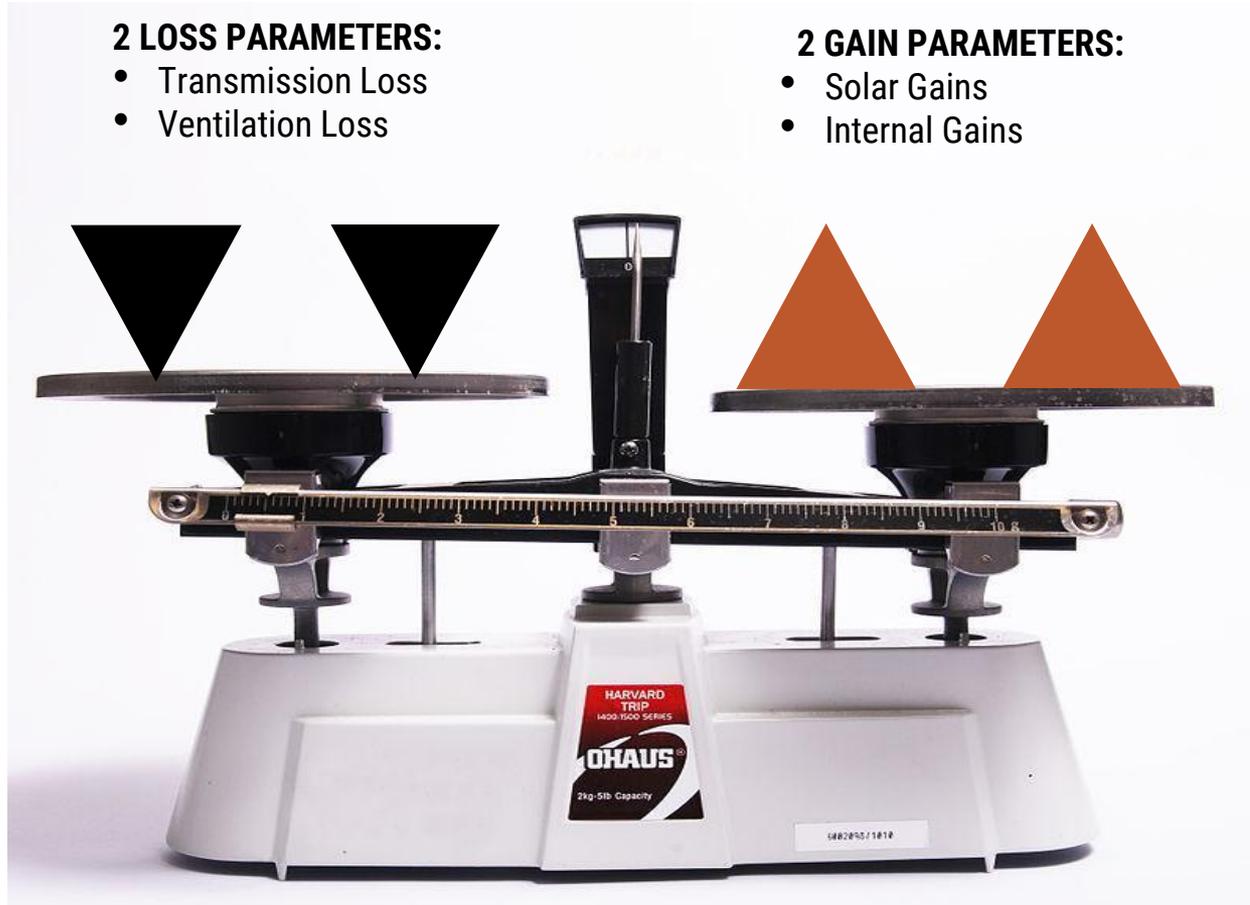

# ENERGY BALANCE

## 2 LOSS PARAMETERS:

- Transmission Loss
- Ventilation Loss

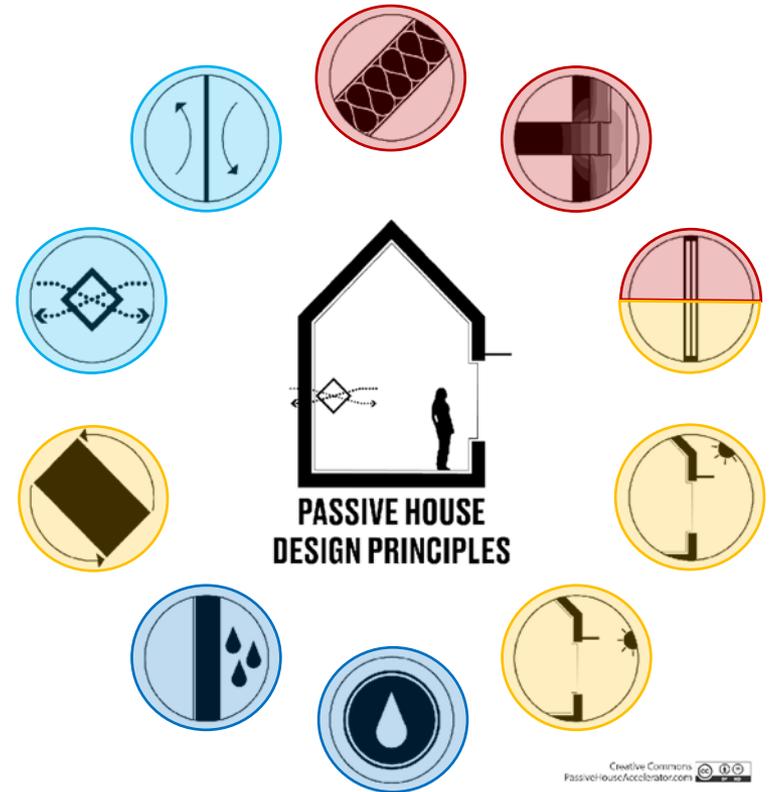

## 2 GAIN PARAMETERS:

- Solar Gains
- Internal Gains

# PASSIVE HOUSE (PH) PRINCIPLES

- Thermal Control
  - High Performance Enclosure
  - Thermal Bridge Elimination
- Air Control
  - Airtightness
  - Balanced ventilation with heat and moisture recovery
- Radiation Control
  - High Performance Glazing
  - Shading and Daylighting
- Moisture Control
  - Material Moisture
  - Air Humidity

# CERTIFYING BODIES

## Phius 2021 Performance Criteria Calculator v3.1

**UNITS:** IMPERIAL (IP) ▼  
**BUILDING FUNCTION:** NON-RESIDENTIAL ▼  
**PROJECT TYPE:** NEW CONSTRUCTION ▼

**STATE/ PROVINCE:** NEW YORK ▼  
**CITY:** NEW YORK LAGUARDIA ▼

**Envelope Area (ft<sup>2</sup>):** 77,560.0  
**iCFA (ft<sup>2</sup>):** 206,059.0  
**Average Occupancy:** 600  
**Design (Max) Occupancy:** 1,000

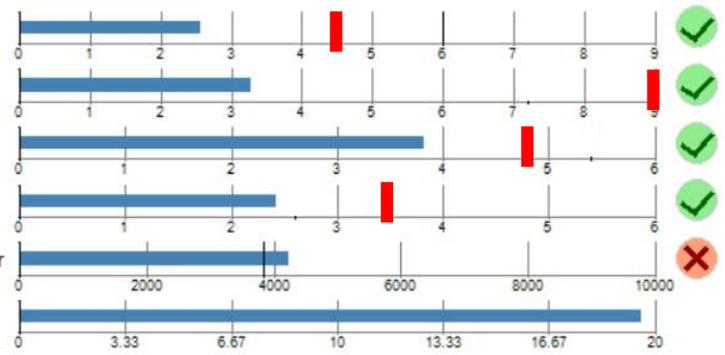

### Space Conditioning Criteria

Annual Heating Demand	4.6	kBtu/ft <sup>2</sup> yr
Annual Cooling Demand	10.7	kBtu/ft <sup>2</sup> yr
Peak Heating Load	4.8	Btu/ft <sup>2</sup> hr
Peak Cooling Load	3.3	Btu/ft <sup>2</sup> hr

### Source Energy Criteria

Phius CORE	24.5	kBtu/ft <sup>2</sup> yr
Phius ZERO	0	kBtu/ft <sup>2</sup> yr

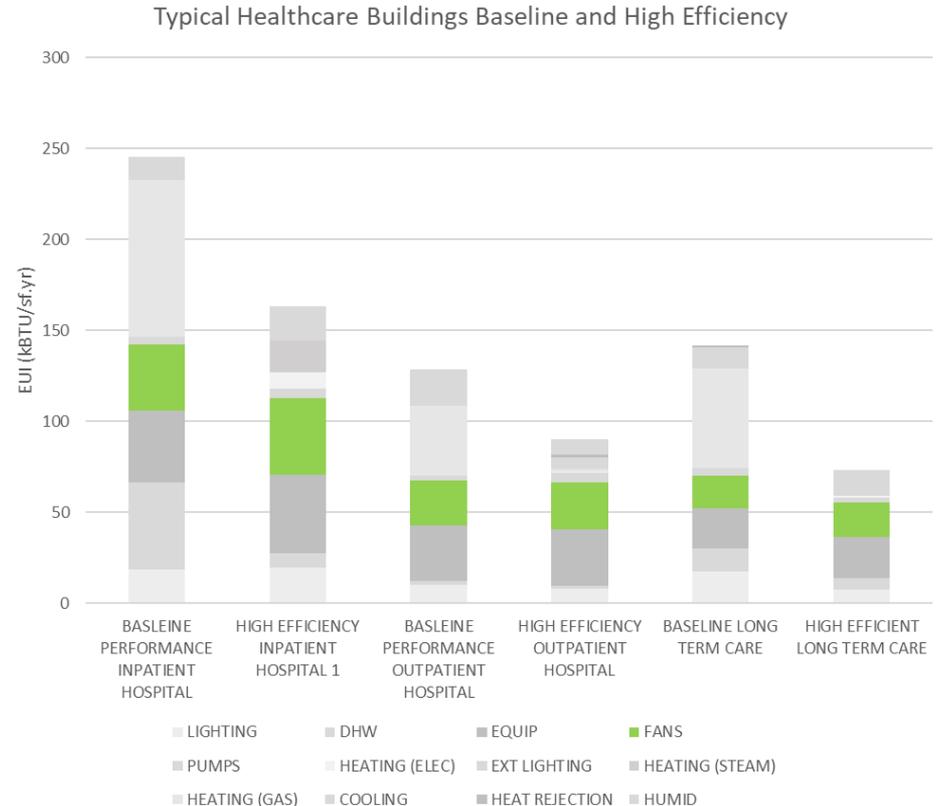

**Heating demand:** 2.55 kBtu/ft<sup>2</sup>yr  
**Cooling demand:** 3.27 kBtu/ft<sup>2</sup>yr  
**Heating load:** 3.81 Btu/hr ft<sup>2</sup>  
**Cooling load:** 2.42 Btu/hr ft<sup>2</sup>  
**Source energy:** 4,242 kWh/Person yr  
**Site energy:** 19.59 kBtu/ft<sup>2</sup>yr

# DEFINING HEALTHCARE ENVIRONMENT: ENERGY INTENSIVE FEATURES

# LARGEST CONTRIBUTORS TO HEALTHCARE ENERGY CONSUMPTION

- Equipment
  - MRI / CT/ Imaging equipment, etc.
- Hot Water and Steam
  - Domestic Hot Water
  - Sterilization
- Occupant Density
  - Patients, faculty and staff, families
- Ventilation
  - ASHRAE 170 rates

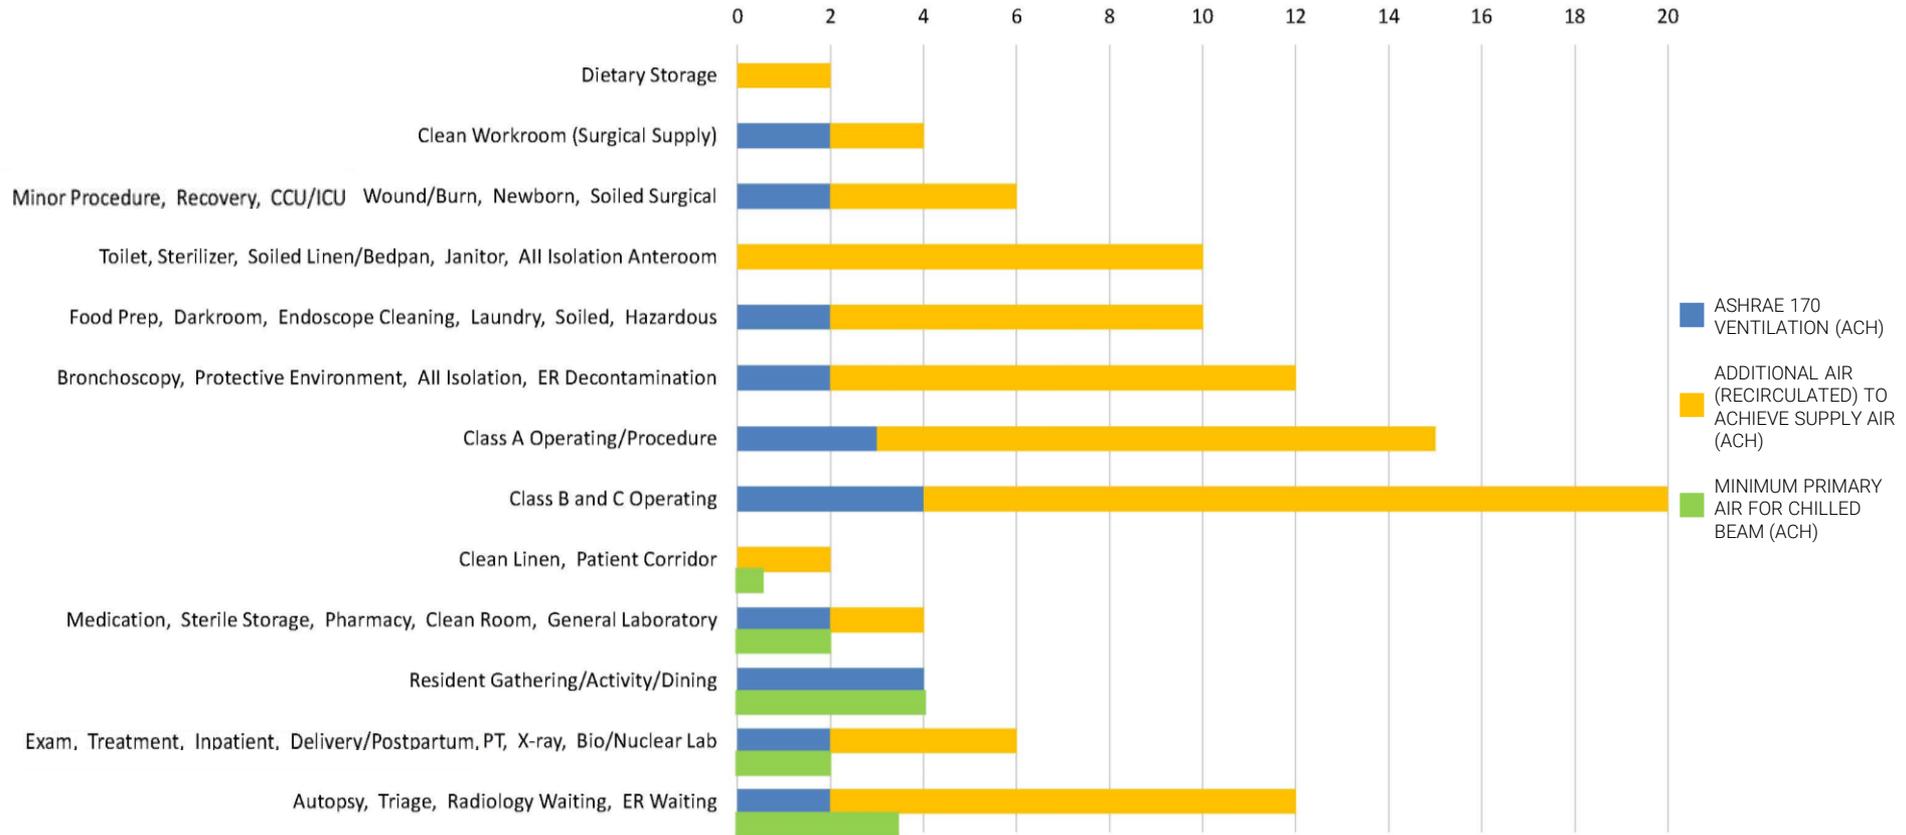

# DEFINE HEALTHCARE TYPOLOGY & VENTILATION REQUIREMENTS

- **Healthcare Typology:** hospitals, in-patient, out-patient, nursing homes, psychiatric facility, etc.
- **ASHRAE 170:** defines ventilation system design requirements for **comfort, health, and contaminants** in healthcare facilities.

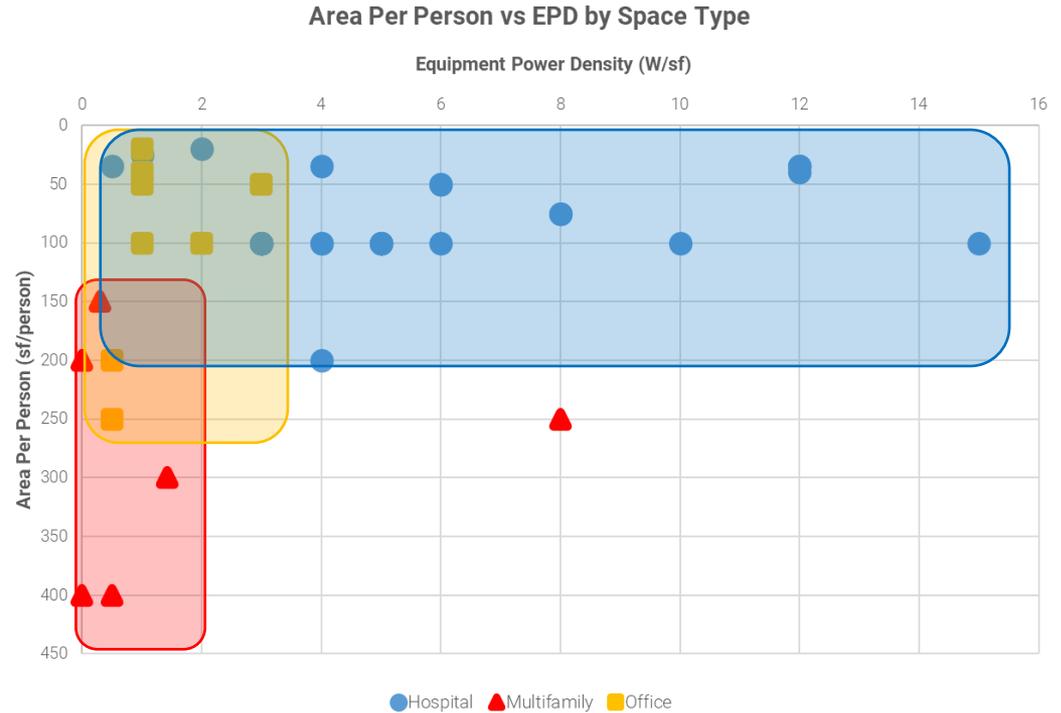

# ASHRAE 170 VENTILATION RATES

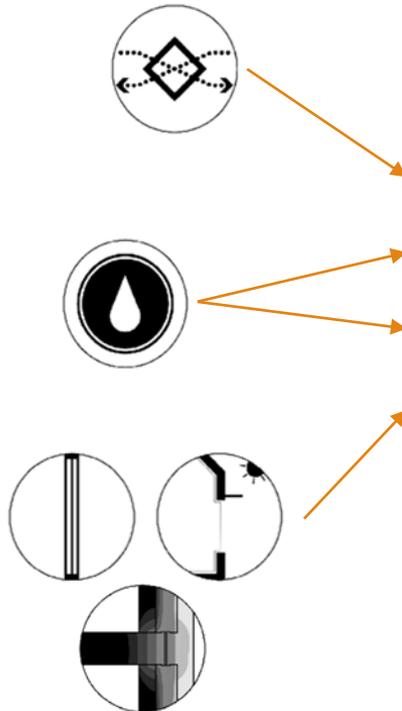

# BENCHMARKING HEALTH CARE SPACE TYPES

Parameter	MF	Office	Healthcare
Ventilation	low	med	high
Occupant Density	low	high	med
Equipment Power Densities	low	med	high

# CHALLENGES APPLYING PH PRINCIPLES TO HEALTHCARE

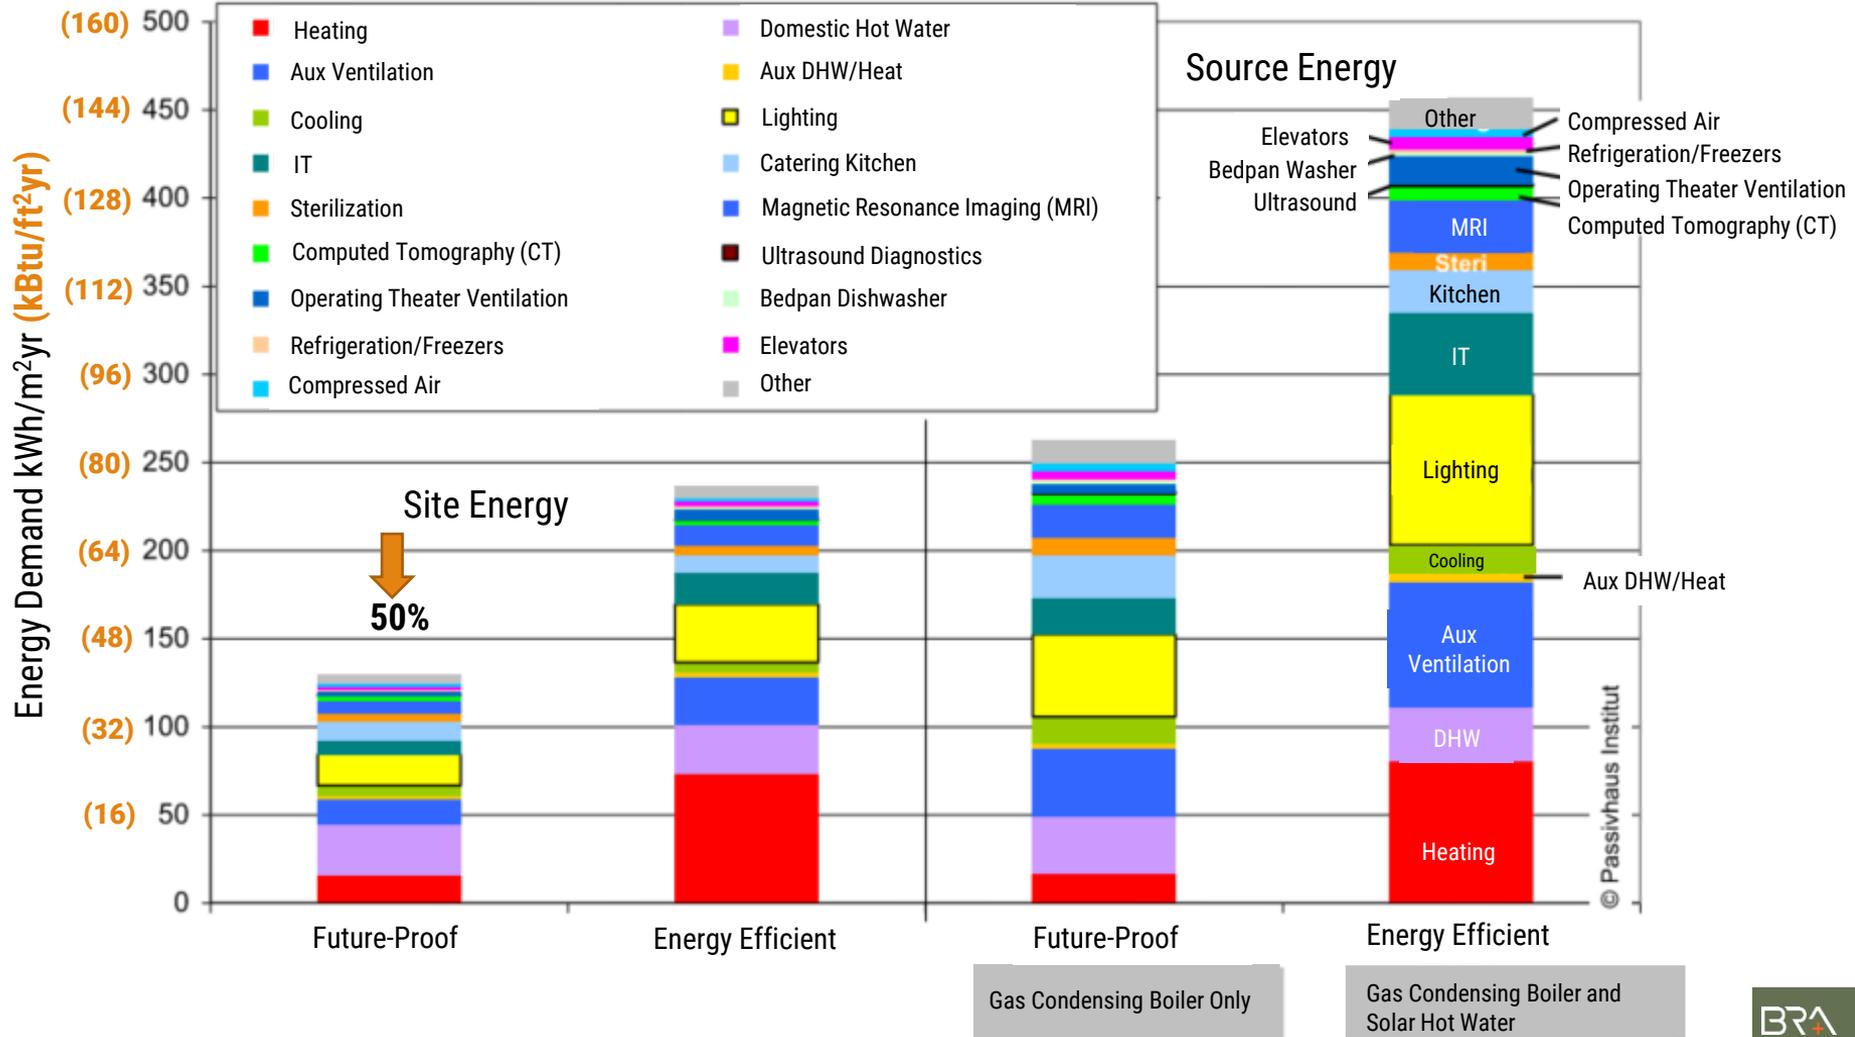

Challenge	Heating Limits	Cooling Limits	Source Energy
ASHRAE 170 Ventilation	X	X	X
Occupant Density		X	
Internal Gains		X	X
High Window-to-Wall Ratio	X	X	
Large Service Hot Water Demand	X		X

# CASE STUDY 1: PH STRATEGIES EMPLOYED

Klinikum Frankfurt Höchst

# CASE STUDY 2: COST OF EMPLOYING PH

# REDUCING LOADS

## ENCLOSURE

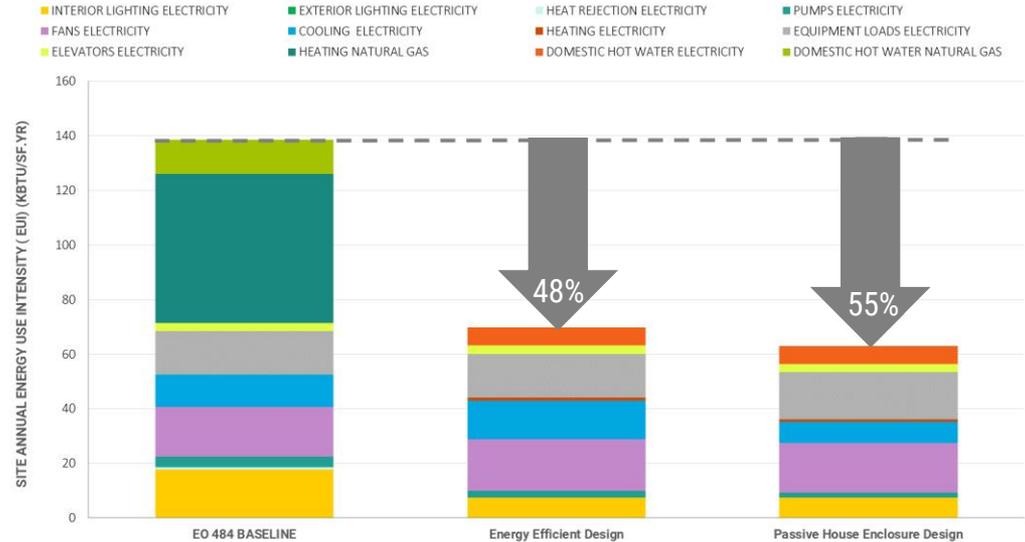

MODEL INPUT PARAMETER	HIGH EFFICIENCY CASE	PASSIVE HOUSE CASE
Wall Assembly - Above Grade	<i>Face brick: U-0.043</i>	<i>Face brick: U-0.030</i>
Vertical Glazing - U-Value	0.19 Curtainwall	0.172 Curtainwall
Air Infiltration	0.083 INF-ACH	0.035 INF-ACH

## VENTILATION ENERGY RECOVERY

MODEL INPUT PARAMETER	HIGH EFFICIENCY CASE	PASSIVE HOUSE CASE
Exhaust Air Energy Recovery	Enthalpy wheel + Desiccant wheel	Dual core

## ANNUAL SITE-ENERGY USE INTENSITY BY END-USE

Long Term Health Care Facility

# LOW CARBON PRINCIPLES IN ACTION

## CONFIDENTIAL LONG-TERM CARE FACILITY

### *Life Cycle Cost Analysis (LCCA)*

All Values in \$ Millions	Baseline Current Design with Solar PV	Baseline no PV Current Design without Solar PV	Alternate Improved Envelope with Solar PV	Alternate no PV Improved Envelope without Solar PV

ADDITIONAL SAVINGS WHEN ACCOUNTING FOR REDUCTION IN CARBON EMISSION FINES FROM LOCAL REGULATIONS LIKE LL97

# CERTIFYING BODIES - BALANCING PERFORMANCE AND COST

## PHIUS BUILDING PROTFOLIO DATA:

- Phius buildings perform up to 85% better than conventional buildings.
- Building to the Phius standard costs only 3-5% more than conventional building methods for a conventional home
- Larger projects benefit from the economy of scale:
  - multifamily passive building typically only costs 0-3% more than a building built to an energy star baseline.

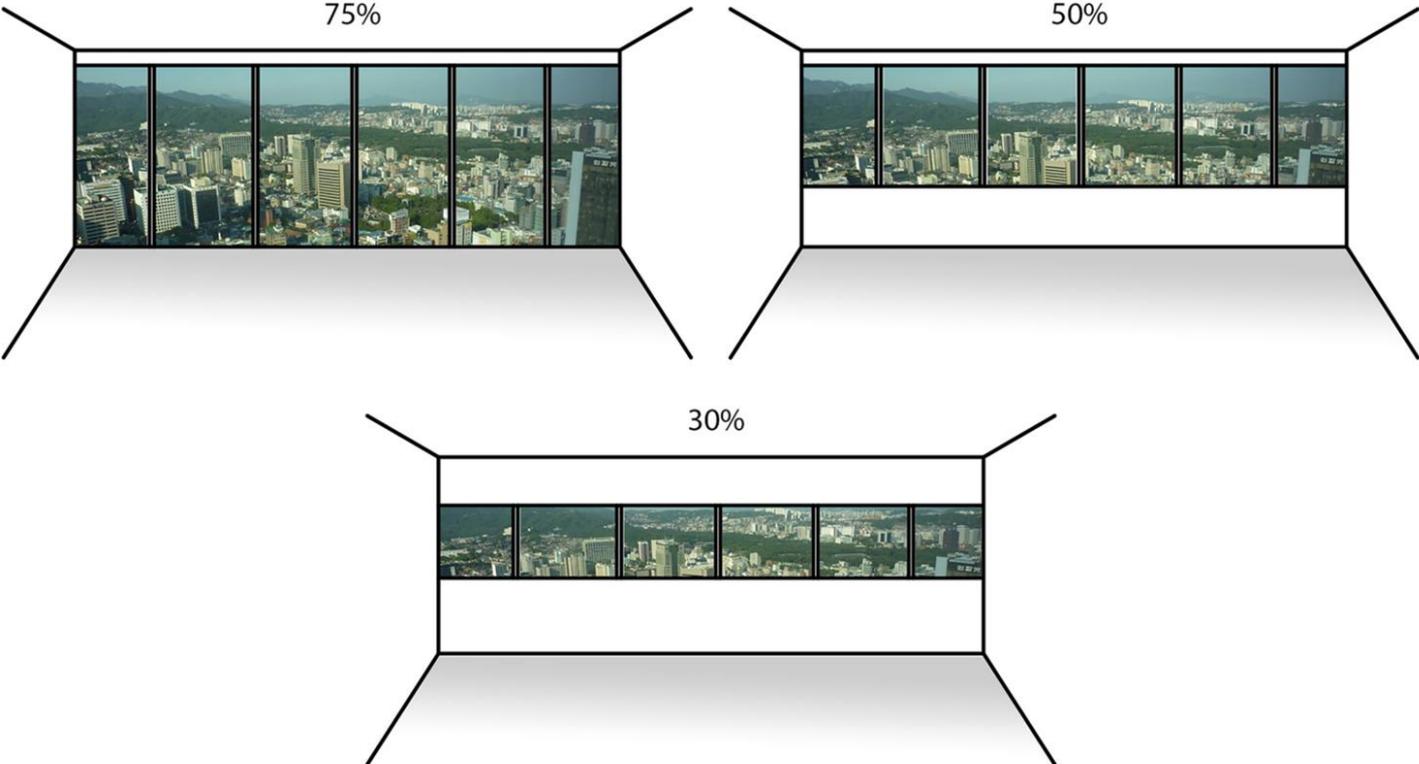

*PHIUS.org*

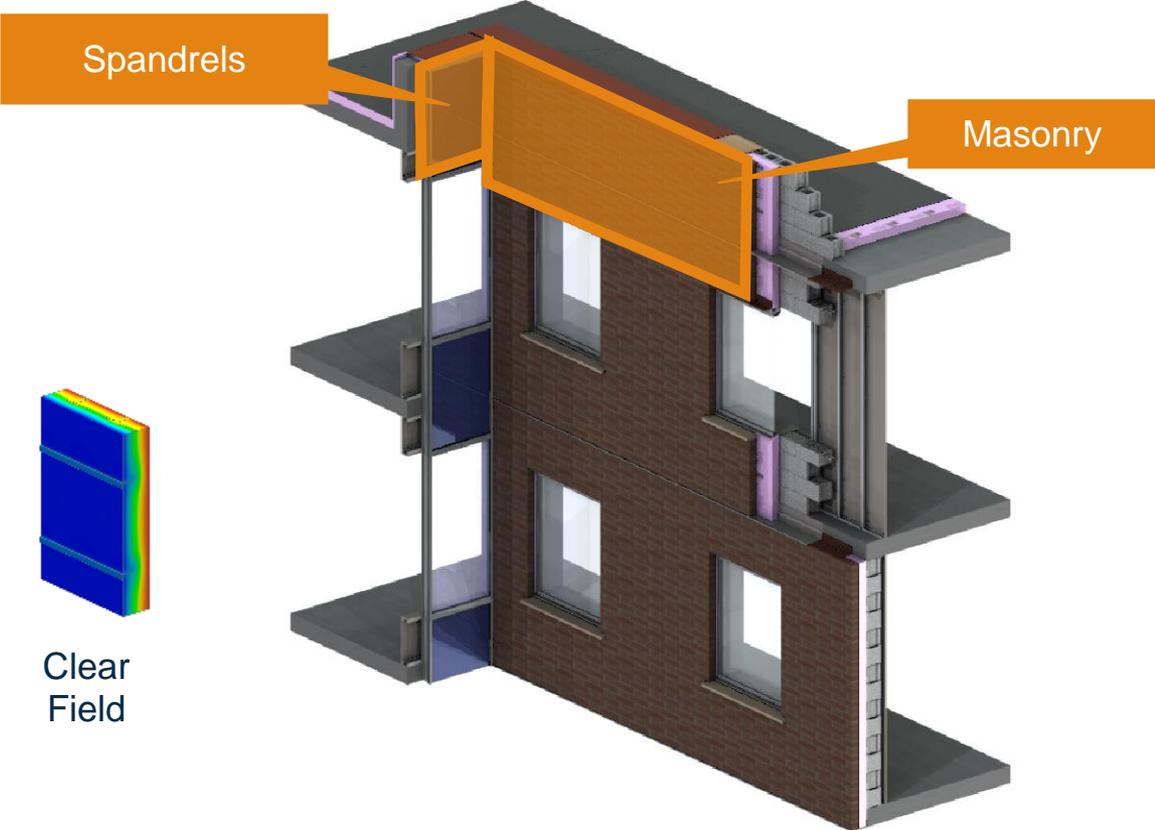

# PASSIVE HOUSE STRATEGIES AND BEST PRACTICES

**ENCLOSURE**

# RETHINKING FENESTRATION TO WALL RATIOS

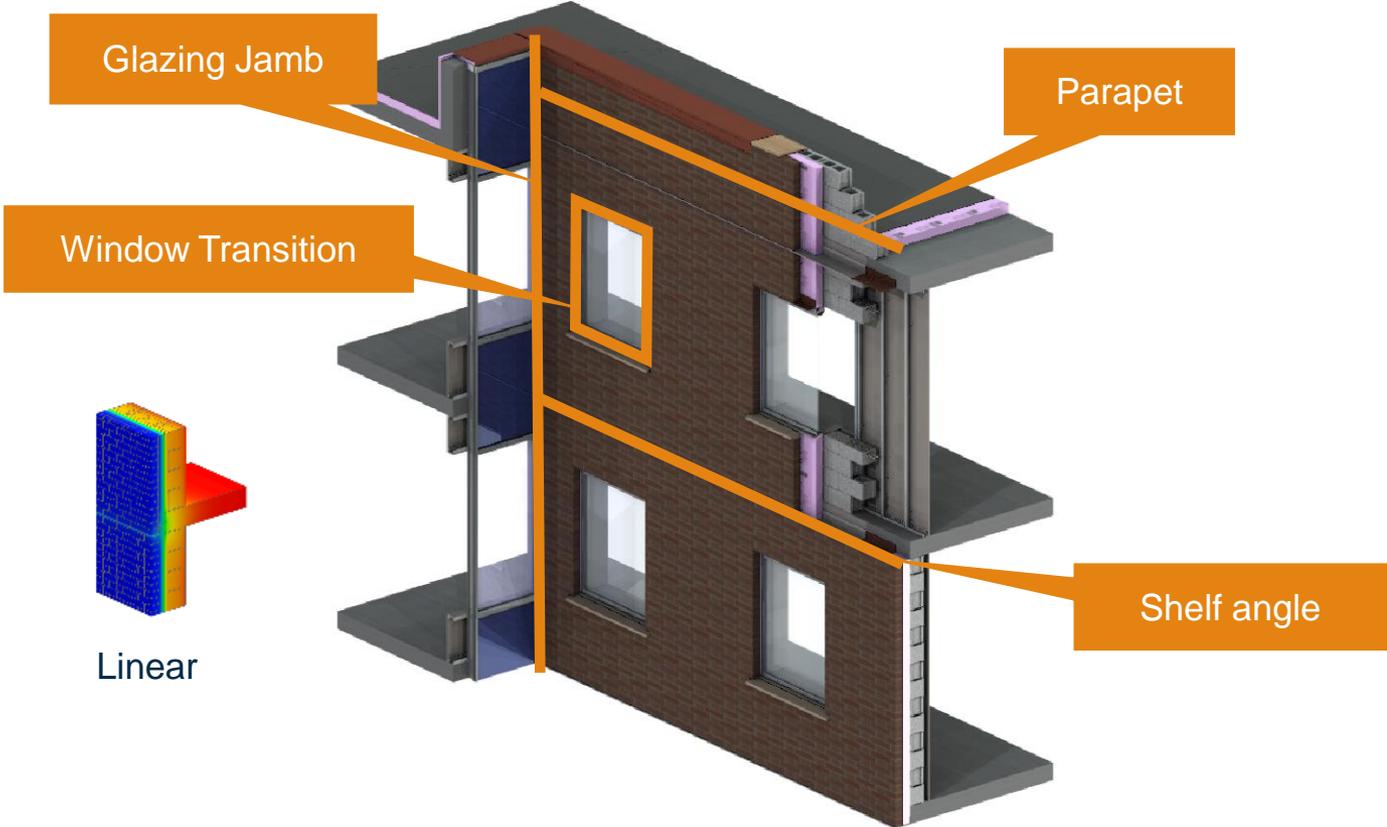

# THERMAL BRIDGING

Images courtesy of Morrison Hershfield

# THERMAL BRIDGING

# GENERAL BEST PRACTICES

# HEATING, AND HOT WATER BEST PRACTICES

## Heating

- **Don't throw away BTUs**
  - Ventilation energy recovery
  - Low temp waste heat + heat pumps
- **Meet with electric equipment**
  - Avoid steam generation
  - Heat Pumps

## DHW

- **Reduce Water Use:** Water saving fixtures
- **Reduce distribution losses:** with efficient layouts
- Wastewater **heat recovery**
- **Meet with Electrified Sources:**
  - Solar thermal
  - DHW HP

# COOLING BEST PRACTICES

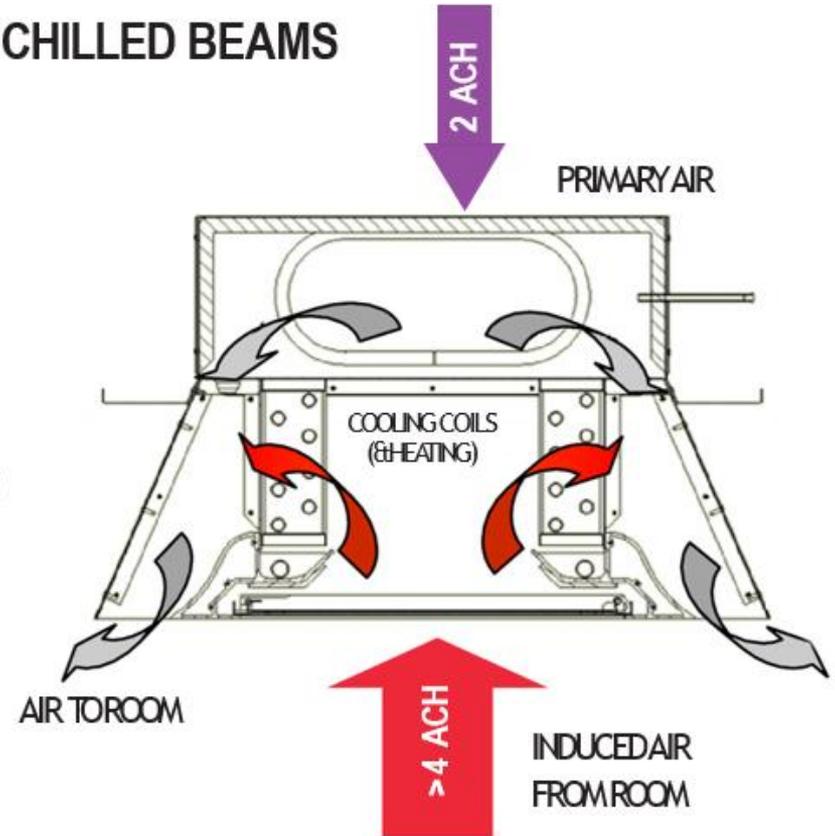

## – Regulate Cooling Load

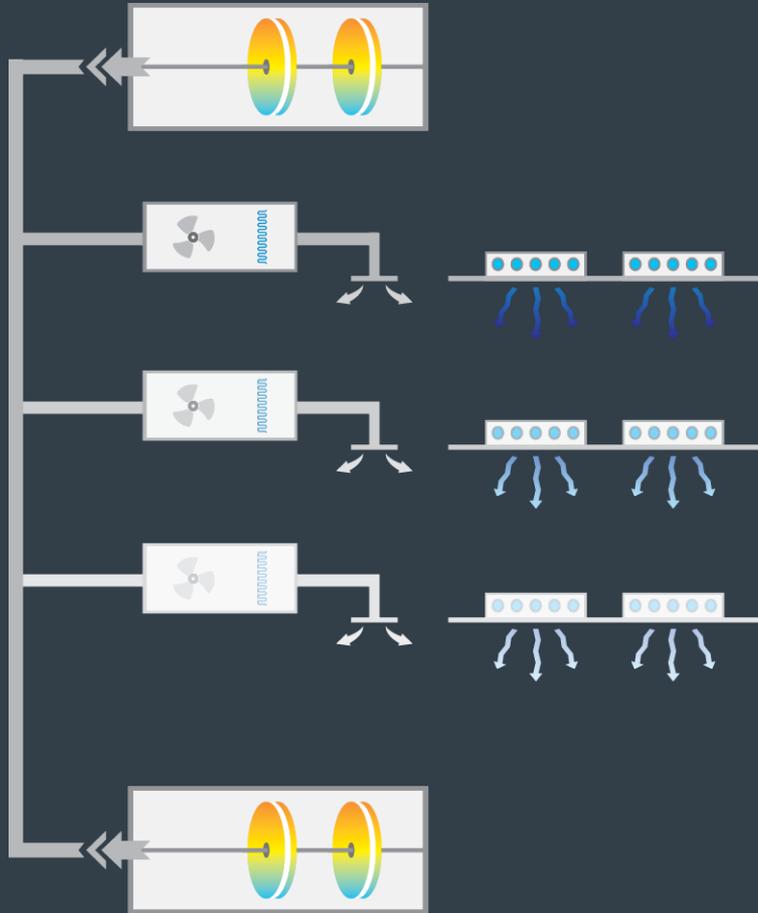

- Reduce internal heat gains
- Reduced solar loads and shading
- Thermal mass (exposed concrete ceilings)

## – Use Efficient Equipment

- Chilled beam
- Night ventilation to help manage humidity
- Avoid ventilation pressure losses
- Efficient fans
- Evaporative cooling within ventilation unit
- Place exhaust or chilled water-cooling circuit at the source of internal heat gains

## CHILLED BEAMS

## VENTILATION BEST PRACTICES TO REDUCE LOADS

- Provide efficient **energy recovery** ( $\geq 80\%$  sensible and  $>75\%$  latent)
- **Simplify** and shorten ventilation duct network
- Avoid unnecessarily high-pressure losses
- Demand control ventilation

# LIGHTING BEST PRACTICES

## Maximize Daylight Utilization.

- In occupied spaces the building design should strive for good daylighting conditions.

## Lighting Design

- Exceed standard reflectance values of walls and ceilings.
- Specify illuminance levels within rooms
- Set targets and limits at an early stage
- Special attention to lighting controls

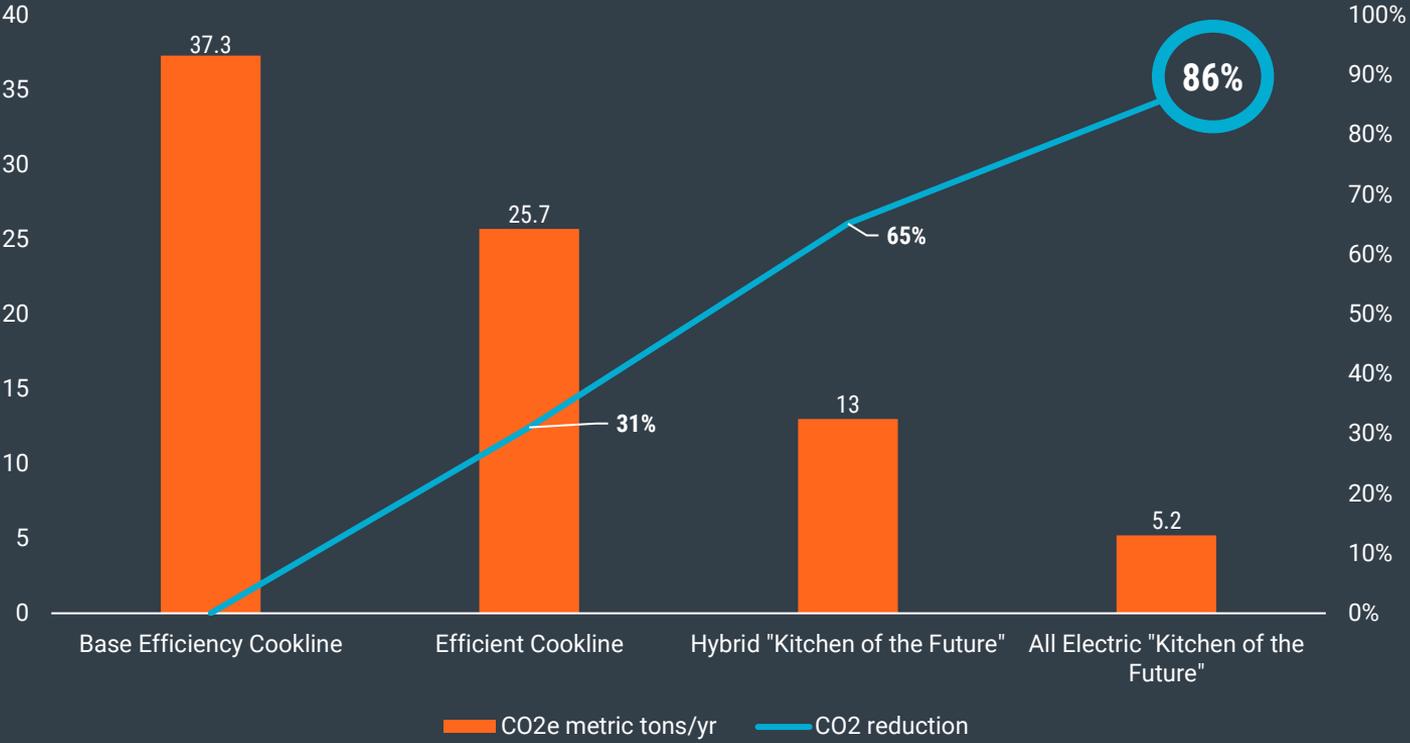

## IT BEST PRACTICES

- Servers with higher temperature tolerance should be used to reduce cooling load.
- Recover server waste heat

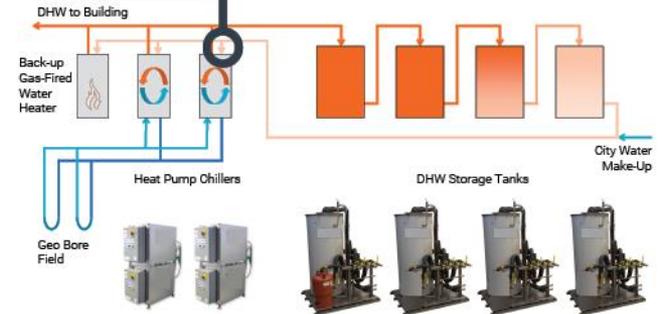

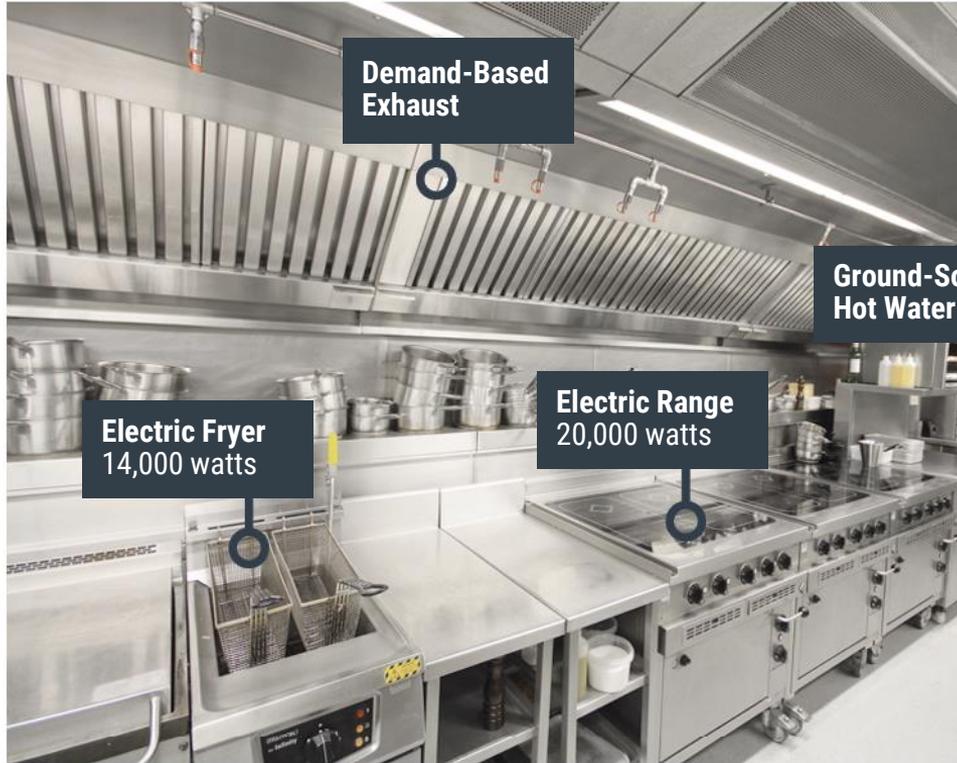

# COMMERCIAL KITCHEN EMISSIONS

## Commercial Kitchen CO2 Impacts

\* Source: Food Service Technology Center 2019

# ALL ELECTRIC KITCHEN

# HEALTHCARE BEST PRACTICES

## MEDICAL APPLIANCES AND DEVICES BEST PRACTICES

Medical and professional equipment, that is currently available, and improved processes offer **savings potentials of more than 30%**

## STERILIZATION AND GLASS WASH BEST PRACTICES

- Washer-disinfectors largest energy end use is heating water and steam.
- Solution: **economical use of water.**
  - Tank systems allow reuse of the hot deionized water from the disinfection phase.
  - Wastewater heat recovery + heat pump system

## MRI

- Carefully review spec sheets
- Can significantly reduce cooling load
- New technology using superconductors shows promise for energy reductions.

## CT

- Compared to previous generation, consumption of current devices is **30% lower**.
- Engage standby mode when not in-use

## OTHER EQUIPMENT

- Medical coolers - Adjust Set Points
- Fume Hoods: Lower VAV Fume Hood Sashes or Automatic Controls
- Solid state lasers > gas lasers.
- Turn off Biosafety cabinets (BSC)
- Reduce compressed air

**CONCLUSIONS**

# CONCLUSIONS

**GOAL: target future proof healthcare facilities while delivering the same quality of care and improving patient outcomes.**

- Prioritizing **envelope efficiency** and **load reduction** strategies to get **operational cost savings** and meet **decarbonization** goals.
- **Mitigating carbon risk** and future liability associated with inefficient facilities **can have significant lifecycle cost savings**, depending on utility rates.
- With early planning and integrated design, best-in class future-proof healthcare facilities can be built **at less than 1% construction cost premium**.

# THANK YOU
